

TI-83 GRAPHING CALCULATOR

BASIC OPERATIONS

by

Carolyn Meitler
Concordia University Wisconsin

B-1 Getting Started

Press **ON** to turn on the calculator.

Press **2nd** **+** to get the MEMORY screen (shown at the right).

Use the down arrow **▼** to choose 5:Reset... and press **ENTER** .

The display now shows the RESET menu (second screen shown at the right).

Use the down arrow **▼** to choose 2: Defaults... and press

ENTER .

A third menu is displayed as shown at the right. Use the down

arrow **▼** to choose 2: Reset and press **ENTER** .

The screen should now display Defaults set. However, the screen may look blank. This is because the contrast setting was also reset and now needs to be adjusted.

Press **2nd** and then hold the **▲** down until you see Defaults set in the middle of the screen. Now the contrast will be dark enough for you to see the screen display.

Press **2nd** **▲** to make the display darker.

Press **2nd** **▼** to make the display lighter.

```

```

To check the battery power, press **2nd** **▲** and note the number that will appear in the upper right corner of the screen. If it is an 8 or 9, you should replace your batteries. The highest number is 9.

Press **CLEAR** to clear the screen.

Press **2nd** **OFF** to turn off the calculator.

B-2 Special Keys, Home Screen and Menus**2nd**

This key must be pressed to access the operation above and to the left of a key. These operations are a yellow color on the face of the calculator. A flashing up arrow \uparrow is displayed as the cursor on the screen after **2nd** key is pressed.

In this document, the functions on the face of the calculator above a key will be referred to in square boxes just as if the function was printed on the key cap. For example, **ANS** is the function above the **(-)** key.

ALPHA

This key must be pressed first to access the operation above and to the right of a key. A flashing **A** is displayed as the cursor on the screen after the **ALPHA** key is pressed.

A-LOCK

2nd **A-LOCK** locks the calculator into alpha mode. The calculator will remain in alpha mode until the **ALPHA** is pressed again.

MODE

Press **MODE**. The highlighted items are active. Select the item you wish using the arrow keys.

Press **ENTER** to activate the selection.

Type of notation for display of numbers.
 Number of decimal places displayed.
 Type of angle measure.
 Function or parametric graphing.
 Connected/not connected plotted points on graphs.
 Graphs functions separately or all at once.
 Allows number to be entered in rectangular complex mode or polar complex mode.
 Allows a full screen or split screen to be used.

```

```

Home Screen

The screen on which calculations are done and commands are entered is called the Home Screen. You can always get to this screen (aborting any calculations in progress) by pressing

2nd **MODE**. From here on, this will be referred to as **2nd** **QUIT** in this appendix.

Menus

The TI-82 Graphics calculator uses menus for selection of specific functions. The items on the menus are identified by numbers followed by a colon. There are two ways to choose menu items:

1. Using the arrow keys to highlight the selection and then pressing **ENTER** .
2. Pressing the number corresponding to the menu item.

In this document the menu items will be referred to using the key to be pressed followed by the meaning of the menu. For example, on the ZOOM menu, **1** :ZBox refers to the first menu item.

B-3 Correcting Errors

It is easy to correct errors on the screen when entering data into the calculator. To do so use the arrow keys, **DEL** , and **INS** keys.

- | | |
|-----------------------|--|
| ◀ or ▶ | Moves the cursor to the left or right one position. |
| ▲ | Moves the cursor up one line or replays the last executed input. |
| ▼ | Moves the cursor down one line. |
| DEL | Deletes one or more characters at the cursor position. |
| 2nd INS | Inserts one or more characters at the cursor position. |

B-4 Calculation

Example 1 Calculate $-8 + 9^2 - \left| \frac{3}{\sqrt{2}} - 5 \right|$.

Turn the calculator on and press **2nd** **QUIT** to return to the Home Screen. Press **CLEAR** to clear the Home Screen. Now we are ready to do a new calculation.

Numbers and characters are entered in the same order as you would read an expression. Do not press **ENTER** unless specifically instructed to do so in these examples. Keystrokes are written in a column but you should enter all the keystrokes without pressing the ENTER key until **ENTER** is displayed in the example.

Solution:

<i>Keystrokes</i>	<i>Screen Display</i>	<i>Explanation</i>
2nd QUIT CLEAR		It is a good idea to clear the screen before starting a calculation.
(-) 8 + 9 ^ 2 -	-8+9^2-abs(3/√(2)-5)	
MATH ►	70.12132034	
1 :abs(3 ÷ 2nd √ 2)		Watch for parentheses that are entered automatically with the operation.
- 5) ENTER		

B-5 Evaluation of an Algebraic Expression

Example 1 Evaluate $\frac{x^4-3a}{8w}$ for $x = \pi$, $a = \sqrt{3}$, and $w = 4!$.

Two different methods can be used to evaluate algebraic expressions:

1. Store the values of the variable, enter the expression, and press **ENTER** to evaluate the expression for the stored values of the variables.
2. Store the expression and store the values of the variables. Recall the expression and press **ENTER** to evaluate the expression for the stored values of the variables.

The advantage of the second method is that the expression can be easily evaluated for several different values of the variables.

Solution:

Method 1

<i>Keystrokes</i>	<i>Screen Display</i>
2nd QUIT	$\pi \rightarrow X$
2nd π STO► X,T,θ,n ENTER	3.141592654
2nd √ 3) STO► ALPHA A ENTER	√(3) →A 1.732050808
4 MATH ►►► 4 :! STO► ALPHA W ENTER	4! →W 24

In this document the notation **4** :! refers to the fourth menu item.

(X,T,θ,n ^ 4 - 3 ALPHA A) ÷	(X^4-3A)/(8W)
(8 ALPHA W) ENTER	.4802757219

Method 2

Keystrokes	Screen Display
CLEAR Y= CLEAR (X,T,θ,n ^ 4 - 3 ALPHA	$Y1 = (X^4 - 3A) / (8W$
A) ÷ (8 ALPHA W))
2nd QUIT

B-7 Graphing, the ZStandard Graphing Screen, and Style of Graph

Before doing any graphing on the calculator, the statistical graphing commands need to be turned off.

2nd STAT PLOT 4 :PlotsOff ENTER

B-8 TRACE, ZOOM, WINDOW, Zero, Intersect and Solver

TRACE allows you to observe both the x and y coordinate of a point on the graph as the cursor moves along the graph of the function. If there is more than one function graphed the up  and down  arrow keys allow you to move between the graphs displayed.

ZOOM will magnify a graph so the coordinates of a point can be approximated with greater accuracy.

Ways to find the x value of an equation with two variables for a given y value are:

1. Zoom in by changing the WINDOW dimensions.
2. Zoom in by setting the Zoom Factors and using Zoom In from the ZOOM menu.
3. Zoom in by using the Zoom Box feature of the calculator.
4. Use the Zero feature of the calculator.
5. Use the Intersect feature of the calculator.
6. Use the Solver feature of the calculator.

Three methods to zoom in are:

1. Change the WINDOW dimensions.
2. Use the **2**:Zoom In option on the **ZOOM** menu in conjunction with **ZOOM** **4**:Set Factors.
3. Use the **1**:ZBox option on the **ZOOM** menu.

Example 1 Approximate the value of x to two decimal places if $y = -1.58$ for $y = x^3 - 2x^2 + \sqrt{x} - 8$.

Solution:

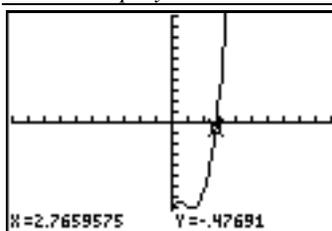

Method 1 Change the WINDOW dimensions.

Enter the function in the $Y=$ list and graph the function using the Standard Graphing Screen (see Section B-7 of this document).

Keystrokes

TRACE  ... 

Screen Display

Explanation

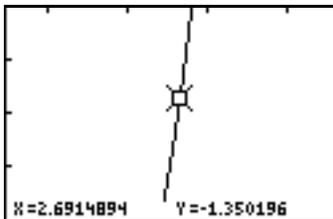

Press the right arrow repeatedly until the new type of cursor gives a y value as close to -1.58 . The closest point is $(2.7659575, -0.47691)$.

WINDOW 2
 ENTER 3 ENTER .1
 ENTER (-) 3 ENTER
 (-) 1 ENTER .1 GRAPH

WINDOW
 Xmin=2
 Xmax=3
 Xscl=.1
 Ymin=-3
 Ymax=-1
 Yscl=.1
 Xres=1

The x coordinate is between 2 and 3. So we set the WINDOW at $2 < x < 3$ with scale marks every .1 by $-3 < y < -1$ with scale marks every .1.

This will be written as [2, 3].1 by [-3, -1].1.

Also, set the xRes to 1. This means that the calculator will calculate a value for y for each value for x for which there is a column of pixels on the graph screen.

Use TRACE again to estimate a new x value. Change the WINDOW appropriately. Repeat using TRACE and changing the WINDOW until the approximation of (2.67, -1.58) has been found. Hence the desired value for x is approximately 2.67.

When using TRACE, the initial position of the cursor is at the midpoint of the x values used for xMin and xMax. Hence, you may need to press the right or left arrow key repeatedly before the cursor becomes visible on a graph.

Occasionally you will see a moving bar in the upper right corner. This means the calculator is working. Wait until the bar disappears before continuing.

Method 2 Use the 2 :Zoom In option on the ZOOM menu.

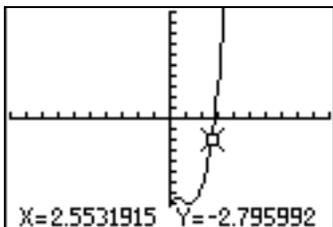

Enter the function in the Y= list and graph the function using the ZStandard Graphing Screen (see Section B-7 of this document).

Keystrokes

ZOOM 6 :ZStandard
 ZOOM ► 4 :Set Factors
 5 ENTER 5
 TRACE ► ... ►

Screen Display

ZOOM FACTORS
 XFact=5
 YFact=5

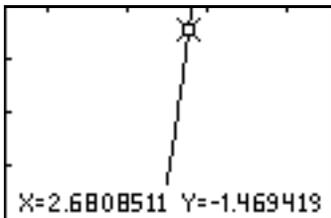

Explanation

Graph the function using the standard graphing screen. Magnification factors need to be set. For this example let us set them at 5 for both horizontal and vertical directions.

Move the cursor using the arrow keys to the point (2.5531915, -2.795992) which has a y value close to -1.58.

ZOOM 2 :Zoom In
 ENTER
 TRACE

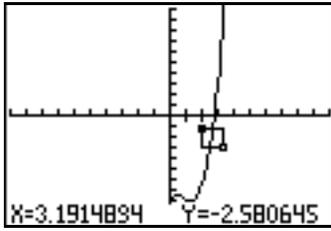

Use the 2 :Zoom In from the ZOOM menu to get a closer look at the x coordinate. Press TRACE to see the coordinates of a point on the graph.

Repeat this procedure until you get a value for the x coordinate accurate to two decimal places. The point has coordinates (2.67, -1.58). Hence the desired value for x is approximately 2.67.

Method 3 Use the 1 :Box option on the ZOOM menu.

Graph the function using the ZStandard Graphing Screen. (See Section B-7 of this document).

Keystrokes	Screen Display	Explanation
ZOOM 6 :ZStandard		Graph the function using the standard graphing screen.
ZOOM 1 :ZBox		Use the arrow keys until the cursor is a little to the left and above the point we are trying to find, say at (2.1276596, -1.290323). Press ENTER.
▶ ... ▼ ENTER		This anchors the upper left corner of the box.
▼ ... ▶ ENTER		Now use the arrow keys to locate the lower right corner of the box, say at (3.1914894, -2.580645). Press ENTER to get the new display.

Repeat using trace and zoom box until you get a value for the y coordinate accurate to two decimal places. The point has coordinates (2.67, -1.58). Hence the desired value for x is approximately 2.67.

Method 4 Use the Zero feature of the calculator.

Keystrokes	Screen Display	Explanation
		Set the expression involving x equal to -1.58, the value of y. Now change the equation so it is equal to zero.
		$x^3 - 2x^2 + \sqrt{x} - 8 = -1.58$
		$x^3 - 2x^2 + \sqrt{x} - 8 + 1.58 = 0.$
		Enter the left side of the equation into the function list and graph.

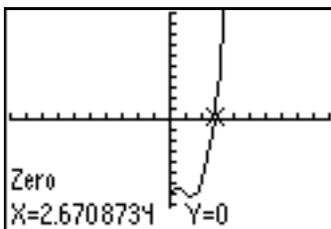

ZOOM 6 :ZStandard

2nd CALC 2 :zero

◀ or ▶ ENTER

◀ or ▶ ENTER

◀ or ▶ ENTER

Get the zero feature.

Place the cursor at a point on the graph to the left of the x intercept, say at $(2.55\dots, -1.21\dots)$.

Place the cursor at a point on the graph to the right of the x intercept, say at $(2.76\dots, 2.20\dots)$.

Place the cursor at a point between the left and right bounds, near to the intercept, for the guess. In this case we can leave the cursor at $(2.76\dots, 2.20\dots)$.

Press ENTER to calculate the x intercept. The x intercept is approximately 2.67. Hence the desired value for x is approximately 2.67.

Method 5 Use the Intersect feature of the calculator.

Graph the function using the ZStandard Graphing Screen. (See Section B-7 of this document).

Keystrokes

Screen Display

Explanation

Y= ▼ ▼

(-) 1.58 2nd QUIT

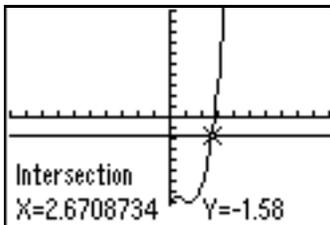

ZOOM 6 :ZStandard

2nd CALC 5 :intersect

◀ ... ▶ ENTER

◀ or ▶ ENTER

◀ or ▶ ENTER

Enter -1.58 as Y2 in the function list.

Graph the function using the standard graphing screen.

Get the intersect feature.

Place the cursor at a point on the first graph near the point of intersection.

Place the cursor at a point on the second graph near the intersection point.

Move the cursor and press enter for the guess.

The intersection point is $(2.67, -1.58)$. Hence the desired value for x is approximately 2.67.

Method 6 Use the Solver feature of the calculator

<i>Keystrokes</i>	<i>Screen Display</i>	<i>Explanation</i>
MATH 0 :Solver...		Write the function as $x^3 - 2x^2 + \sqrt{x} - 8 - (-1.58)$. Enter this as Y1 in the function list.
▲	EQUATION SOLVER eqn: 0=Y1	Get the EQUATION SOLVER. Recall Y1 from the function list.
VARS ▶ 1 :Function		
ENTER 2	Y1=0 ■ X=2.6708734439...	Continue the Solver function. Type 2 as the guess.
ALPHA SOLVE	bound={-1E99,1... ■ left-rt=0	SOLVE is above the ENTER key.
		Hence the desired value for x is approximately 2.67.

Example 2 Approximate the x intercept to two decimal places for $y = x^3 - 2x^2 + \sqrt{x} - 8$.

There are several ways to get a closer look at the intercept:

1. Change the WINDOW dimensions.
2. Set the Zoom Factors and zoom in.
3. Use the Zoom Box feature of the calculator.
4. Use the Zero feature of the calculator.
5. Use the Intersect feature of the calculator.
6. Use the Solver feature of the calculator.

Method 1 Change the WINDOW dimensions.

This method is described in Section B-8 Example 1 Method 1 of this document.

Method 2 Set the Zoom Factors and zoom in.

This method is described in Section B-8 Example 1 Method 2 of this document.

Method 3 Use the Zoom Box feature of the calculator.

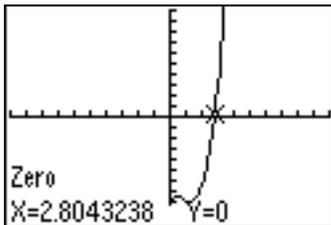

This method is described in Section B-8 Example 1 Method 3 of this document.

Method 4 Use the Zero feature of the calculator.

<i>Keystrokes</i>	<i>Screen Display</i>	<i>Explanation</i>
ZOOM 6 :ZStandard		Graph the function.
2nd CALC 2 :zero		Get the zero feature.
◀ or ▶ ENTER		Place the cursor at a point on the graph to the left of the x intercept.

◀ or ▶ ENTER

◀ or ▶ ENTER

Place the cursor at a point on the graph to the right of the x intercept.

For the guess.

The x intercept is 2.80.

Method 5 Use the Intersect feature of the calculator. This method is described in Section B-8 Example 1 Method 4 of this document

Method 6 Use the Solver feature of the calculator. This method is described in Section B-8 Example 1 Method 5 of this document.

B-9 Determining the WINDOW Dimensions and Scale Marks

There are several ways to determine the limits of the x and y axes to be used in setting the WINDOW. Three are described below:

1. Graph using the default setting of the calculator and zoom out. The disadvantage of this method is that often the function cannot be seen at either the default settings or the zoomed out settings of the WINDOW.
2. Evaluate the function for several values of x . Make a first estimate of the window dimensions based on these values.
3. Analyze the leading coefficient and/or the constant terms.

A good number to use for the scale marks is one that yields about 20 marks across the axis. For example if the WINDOW is $[-30, 30]$ for an axis then a good scale value is $(30 - (-30))/20$ or 3.

Example 1 Graph the function $f(x) = .2x^2 + \sqrt[3]{x} - 32$.

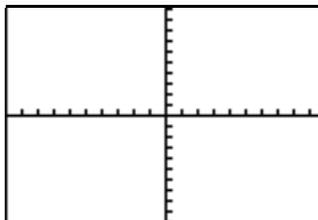

Solution:

Method 1 Use the default setting and zoom out.

Keystrokes

Y= CLEAR .2 X,T,θ,n ^
 2 + MATH 4 : $\sqrt[3]{}$
 X,T,θ,n) - 32 ZOOM 6
 :ZStandard

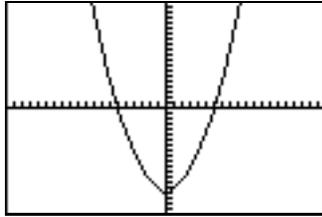

Screen Display

Explanation

Nothing is seen on the graph screen because no part of this curve is in this WINDOW.

$\boxed{\text{ZOOM}} \boxed{\blacktriangleright} \boxed{4}$:Set Factors $\boxed{4}$
 $\boxed{\text{ENTER}} \boxed{4}$
 $\boxed{\text{ZOOM}} \boxed{3}$:Zoom Out
 $\boxed{\blacktriangledown} \dots \boxed{\blacktriangleright} \boxed{\text{ENTER}}$

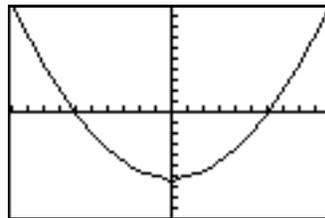

Set the zoom factors.

After pressing $\boxed{\text{ZOOM}} \boxed{3}$ use the arrow keys to move the cursor to the point you wish to be the center of the new zoom screen. We chose (0, 0). Zooming out shows a parabolic shaped curve.

Method 2 Evaluate the function for several values of x . (See Section B-5 on how to evaluate a function at given values of x .)

x	$f(x)$
-20	45.3
-10	-14.2
0	-32.0
10	-9.8
20	50.7

Analyzing this table indicates that a good WINDOW to start with is $[-20,20]2$ by $[-50,50]5$. Note the scale is chosen so that about 20 scale marks will be displayed along each of the axes. The scale is chosen as 2 for the x axis since $[20-(-20)]/20=2$ and 5 for the y axis since $[50-(-50)]/20=5$.

Method 3 Analyze the leading coefficient and constant terms.

Since the leading coefficient is .2 the first term will increase .2 units for each 1 unit x^2 increases or 2 units for each 10 units x^2 increases. This means that the first term will increase for every $\sqrt{10}$ (or about 3 units increase) in x . A first choice for the x axis limits can be found using:

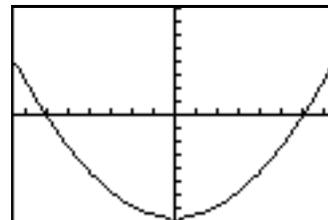

$$\frac{10 \times (\text{unit increase in } x)}{(\text{first term increase})} = \frac{10 \times 3}{2} = 15$$

A first choice for the scale on the x axis (having about 20 marks on the axis) can be found using $\frac{X_{\text{max}} - X_{\text{min}}}{20} = \frac{15 - (-15)}{20} = 1.5$ (round to 2). So the limits on the x axis could be $[-15,15]2$.

A first choice for the y axis limits could be $\pm(\text{constant term})$.

The scale for the y axis can be found using $\frac{Y_{\text{max}} - Y_{\text{min}}}{20} = \frac{32 - (-32)}{20} = 3.2$ (round to 4). So a first choice for the y axis

limits could be $[-32,32]4$. Hence a good first setting for the WINDOW is $[-15,15]2$ by $[-32,32]4$.

$[-15, 15]2$ by $[-32, 32]4$

A good choice for the **scale** is so that about 20 marks appear along the axis.
 This is $\frac{X_{\max}-X_{\min}}{20}$ (rounded up to the next integer) for the x axis and
 $\frac{Y_{\max}-Y_{\min}}{20}$ (rounded up to the next integer) for the y axis.

B-10 Piecewise-Defined Functions

There are two methods to graph piecewise-defined functions:

1. Graph each piece of the function separately as an entire function on the same coordinate axes. Use trace and zoom to locate the partition value on each of the graphs.
2. Store each piece of the function separately but include an inequality statement following the expression which will set the WINDOW of values on x for which the function should be graphed. Then graph all pieces on the same coordinate axes.

Example 1 Graph $f(x) = \begin{cases} x^2+1 & x < 1 \\ 3x-5 & x \geq 1 \end{cases}$

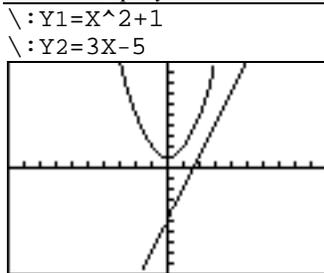

Solution:

Method 1

Keystrokes

Y= CLEAR X,T,θ,n ^
 2 + 1 ENTER
 CLEAR 3 X,T,θ,n
 - 5 ZOOM 6 :ZStandard

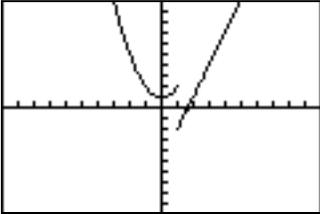

Screen Display

Explanation

Store the functions. Graph. Both functions will be displayed. Use trace and zoom to find the point on the graphs where $x=1$. When drawing this curve on paper, place an open circle on as the endpoint of the piece of the graph not including $x=1$ and a closed circle as the endpoint of the piece of the graph including $x=1$.

Method 2

Keystrokes	Screen Display	Explanation
Y= CLEAR (X,T,θ,n	\ :Y1=(X^2+1)/(X<1)	The logical statement $x < 1$ will give a 1 when the value of x is less than 1 and a 0 when the value of x is greater than or equal to 1. Hence the first part of the function is divided by 1 when $x < 1$ and 0 when $x \geq 1$. The function will not graph when it is divided by 0. Similarly for the logical statement $x \geq 1$ for the second part of the function. The 1 and 0 are not shown on the screen but are used by the calculator when graphing the functions.
^ 2 +	\ :Y2:(3X-5)/(X≥1)

(X,T,θ,n 2nd TEST		
4 :≥ 1)		
ZOOM 6 :ZStandard		

B-11 Solving Equations in One Variable

There are three methods for approximating the solution of an equation:

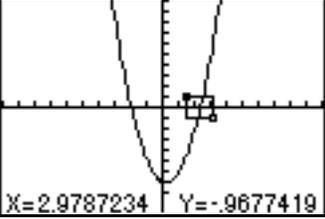

1. Write the equation as an expression equal to zero. Graph $y=(\text{the expression})$. Find the x intercepts. These x values are the solution to the equation. This can be done using TRACE and ZOOM or using the Solver from the MATH menu. See Section B-8 of this document.
2. Graph $y=(\text{left side of the equation})$ and $y=(\text{right side of the equation})$ on the same coordinate axes. The x coordinate of the points of intersection are the solutions to the equation. This can be done using TRACE and ZOOM or using intersect from the CALC menu.

Example 1 Solve $\frac{3x^2}{2} - 5 = \frac{2(x+3)}{3}$.

Solution:

Method 1 Using TRACE and ZOOM

Write the equation as $\left(\frac{3x^2}{2} - 5\right) - \left(\frac{2(x+3)}{3}\right) = 0$. Graph $y = \left(\frac{3x^2}{2} - 5\right) - \left(\frac{2(x+3)}{3}\right)$. Now we want to find the x value where the graph crosses the x axis. This is the x intercept.

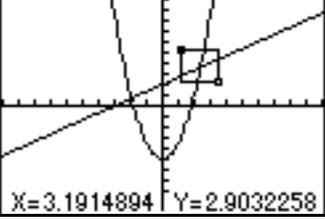

Keystrokes	Screen Display	Explanation
Y= CLEAR (3	$\backslash Y1 = (3X^2/2 - 5) - (2(X+3)/3)$	Store the expression as Y1.
X,T,θ,n ^ 2 ÷ 2		Use trace and zoom to find the x intercepts. They are: $x \approx -1.95$ and $x \approx 2.39$. Hence, the solutions are: $x \approx -1.95$ and $x \approx 2.39$.
- 5) - (2

		A typical zoom box is shown on the graph at the left. (See Method 3 of Section B-8.)

Method 1 Using Solver

Keystrokes	Screen Display	Explanation
MATH 0 :Solver ▲ (EQUATION SOLVER	The keystrokes given require the function to be entered in the Solver command. You could store the left and right side of the equation as Y1 and Y2 and put Y1-Y2 as the function in the Solver command.
3 X,T,θ,n ^ 2 ÷ 2	eqn: 0 = (3X^2/2 - 5) -	Enter 2 as the initial guess.
- 5) - (2	(2(X+3)/3)	The approximate solutions to this equation are -1.95 and 2.39, rounded to two decimal places.
(X,T,θ,n + 3)	(3X^2.2-5)-(2...=0	
÷ 3) ENTER 2	■ X=2.3938689206...	
ALPHA SOLVE	bound={-1E99,1...	
	■ left-rt=0	

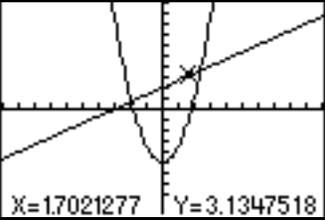

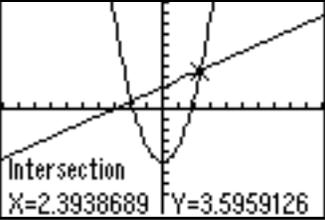

Method 2 Using TRACE and ZOOM

Graph $y = \frac{3x^2}{2} - 5$ and $y = \frac{2(x+3)}{3}$ on the same coordinate axes and find the x coordinate of their points of intersection.

Keystrokes	Screen Display	Explanation
Y= CLEAR 3 X,T,θ,n ^	$\backslash Y1 = 3X^2/2 - 5$	Store the two functions.
2 ÷ 2 - 5 ENTER	$\backslash Y2 = 2(X+3)/3$	
CLEAR 2 (X,T,θ,n +		
3) ÷ 3		
ZOOM 6 :ZStandard		
	X=3.1914894 Y=2.9032258	
		Find the points of intersection. Use trace and zoom to find the x values: $x \approx -1.95$ and $x \approx 2.39$. A typical zoom box is shown on the graph at the left.

Method 2 Using Intersect

Graph $y = \frac{3x^2}{2} - 5$ and $y = \frac{2(x+3)}{3}$ on the same coordinate axes and find the x coordinate of their points of intersection.

Keystrokes	Screen Display	Explanation
$\boxed{Y=}$ \boxed{CLEAR} $\boxed{3}$ $\boxed{X,T,\theta,n}$ $\boxed{\wedge}$	$\backslash Y_1=3X^2/2-5$	Store the two functions and graph using the standard window dimensions.
$\boxed{2}$ $\boxed{\div}$ $\boxed{2}$ $\boxed{-}$ $\boxed{5}$ \boxed{ENTER}	$\backslash Y_2=2(X+3)/3$	
\boxed{CLEAR} $\boxed{2}$ $\boxed{(}$ $\boxed{X,T,\theta,n}$ $\boxed{+}$		
$\boxed{3}$ $\boxed{)}$ $\boxed{\div}$ $\boxed{3}$		
\boxed{ZOOM} $\boxed{6}$:ZStandard		
$\boxed{2nd}$ \boxed{CALC} $\boxed{5}$:intersect		Select intersect from the CALC menu.
\boxed{ENTER}		Select the first curve. Look in the upper right corner for the function number.
\boxed{ENTER}		Select the second curve.
$\boxed{\blacktriangleright}$... $\boxed{\blacktriangleright}$ \boxed{ENTER}		Move the cursor so it is near the intersection point and press ENTER.
		
		The approximate solution is 2.39. Use intersect again to find the other solution of -1.95.

Hence the approximate solutions to this equation are -1.95 and 2.39.

B-12 Solving Inequalities in One Variable

Two methods for approximating the solution of an inequality using graphing are:

1. Write the inequality with zero on one side of the inequality sign. Graph $y=(\text{the expression})$. Find the x intercepts. The solution will be an inequality with the x values (x intercepts) as the cut off numbers. The points of intersection can be found using TRACE and ZOOM or using the SOLVE(from the MATH menu.

2. Graph y =(left side of the inequality) and y =(right side of the inequality) on the same coordinate axes. The x coordinate of the points of intersection are the solutions to the equation. Identify which side of the x value satisfies the inequality by observing the graphs of the two functions. The points of intersection can be found using TRACE and ZOOM or using intersect from the CALC menu.

Example 1 Approximate the solution to $\frac{3x^2}{2} - 5 \leq \frac{2(x+3)}{3}$. Use two decimal place accuracy.

Solution:

Method 1

Write the equation as $\left(\frac{3x^2}{2} - 5\right) - \left(\frac{2(x+3)}{3}\right) \leq 0$. Graph $y = \left(\frac{3x^2}{2} - 5\right) - \left(\frac{2(x+3)}{3}\right)$ and find the x intercepts. This was done in Section B-10 Example 1 Method 1.

The x intercepts are -1.95 and 2.39 . The solution to the inequality is the interval on x for which the graph is below the x axis. The solution is $-1.95 \leq x \leq 2.39$.

Method 2 Graph $y = \frac{3x^2}{2} - 5$ and $y = \frac{2(x+3)}{3}$ on the same coordinate axes and find the x coordinate of their points of intersection. See Section B-10 Example 1 Method 2. The x coordinate of the points of intersections are -1.95 and 2.39 . We see that the parabola is below the x line for $-1.95 \leq x \leq 2.39$. Hence the inequality is satisfied for $-1.95 \leq x \leq 2.39$.

To test this inequality, choose -2 as a test value. Evaluating the original inequality using the calculator yields a 0 which means the inequality is not true for this value of x . (See Section D-6 of this document.) Repeat the testing using 0 and 3 . We see that the inequality is true for $x=0$ and not true for $x=3$. Hence the inequality is satisfied for $-1.95 \leq x \leq 2.39$.

B-13 Storing an Expression That Will Not Graph

Example 1 Store the expression $B^2 - 4AC$ so that it will not be graphed but so that it can be evaluated at any time. Evaluate this expression for $A=3$, $B=2.58$, and $C=\sqrt{3}$.

Solution:

Keystrokes	Screen Display	Explanation
Y= ▾ ▾ ▾ CLEAR		Choose Y4 using the arrow keys. (Any of Y1, Y2, Y3, ... could be used.) Store the expression.
ALPHA B ^ 2 - 4	\Y4=B^2-4A*C	Use the left arrow repeatedly until the cursor is over the = sign. Press ENTER . The highlighting will disappear from the = sign. Now you can still evaluate the expression by recalling it, but it will not graph.
ALPHA A x ALPHA C		
◀ ... ◀ ENTER

$\boxed{\text{MATRX}}$ $\boxed{\blacktriangleright}$ $\boxed{2}$ $\boxed{:}$ $\boxed{\text{T}}$ $\boxed{\text{ENTER}}$	$\begin{bmatrix} 1 & 3 & 5 \\ -2 & 0 & -8 \end{bmatrix}$	

Solution (D):

Keystrokes	Screen Display	Explanation
$\boxed{\text{MATRX}}$ $\boxed{\blacktriangleright}$ $\boxed{1}$ $\boxed{:}$ $\boxed{\text{det}}$	$\text{det}[\text{B}]$	Choose the determinant option from the matrix menu.
$\boxed{\text{MATRX}}$ $\boxed{2}$ $\boxed{:}$ $\boxed{\text{B}}$ $\boxed{)}$ $\boxed{\text{ENTER}}$	133	

Example 2 Find the reduced form of matrix $\begin{bmatrix} 2 & 1 & 5 & 1 \\ 3 & 2 & -1 & -5 \\ 0 & 8 & -3 & 10 \end{bmatrix}$.

Solution:

There are two methods that can be used:

1. Use the row operations individually.
2. Use rref(from the MATRX MATH menu.

Method 1 Using row operations

Keystrokes	Screen Display	Explanation
MATRIX ▶ ▶	NAMES MATH EDIT 1: [A] 2: [B] 3: [C] 4: [D] 5: [E]	Enter the matrix mode and choose EDIT using the arrow keys. If there are numbers after the matrix name, this means that there are numbers already stored in the matrix. This does not matter. Continue as directed below. Choose the A matrix.
1 : [A]	MATRIX[A] 3 x4	
3 ENTER 4 ENTER	[0 0 0 ... [0 0 0 ... [0 0 0 ...	Store the dimensions of the matrix.
2 ENTER 1 ENTER		
5 ENTER 1 ENTER	1, 1 =0	Enter the elements row by row.
3 ENTER 2 ENTER etc.		
2nd QUIT		When all elements are entered, press 2nd QUIT to get the Home Screen.
MATRIX 1 : [A] ENTER		Display the matrix from the MATRIX menu.
MATRIX ▶ ALPHA	*row(.5, [A], 1)	Multiply row 1 of matrix A by .5. Another way to say this that might help to remember the order of entries within the parentheses is to think:
E : *row(.5	[[1 .5 2.5 .5] [3 2 -1 -5] [0 8 -3 10]]	.5 times matrix A row 1.
, MATRIX 1 : [A]		
, 1) ENTER		
STO▶ MATRIX 1 : [A]	Ans→[A]	Store the result in matrix A location. It is a good idea to store the answer. You can always operate on the latest answer using 2nd ANS .
ENTER	[[1 .5 2.5 .5] [3 2 -1 -5] [0 8 -3 10]]	
MATRIX ▶ ALPHA F	*row+(-3, [A], 1, 2)	However, if you make a mistake and the new matrix is not stored, you will need to start over from the beginning.
: *row+((-) 3 ,	[[1 .5 2.5 .5 ...] [0 .5 -8.5 -6. ...] [0 8 -3 10 ...]]	
MATRIX 1 : [A] ,		
1 , 2) ENTER		Multiply -3 times matrix A row 1 to add to row 2.
STO▶	Ans→[A]	Store the result as matrix A.
MATRIX 1 : [A] ENTER	[[1 .5 2.5 .5 ...] [0 .5 -8.5 -6. ...] [0 8 -3 10 ...]]	

MATRIX ▶ ALPHA	*row(2, [A], 2)	2 times matrix A row 2.
E :row(2 , MATRIX	[[1 .5 2.5 .5]	
1 : [A] , 2) ENTER	[0 1 -17 -13]	
STO ▶ MATRIX	[0 8 -3 10]]	
1 : [A] ENTER	Ans→[A]	Store the result as matrix A.
	[[1 .5 2.5 .5]	
	[0 1 -17 -13]	
	[0 8 -3 10]]	

Continue using row operations to arrive at the reduced form of $\begin{bmatrix} 1 & 0 & 0 & -2.428\dots \\ 0 & 1 & 0 & 1.571\dots \\ 0 & 0 & 1 & .857\dots \end{bmatrix}$.

To swap rows of a matrix use **ALPHA** **C** :rowSwap(from the **MATRIX** **▶** menu.

To swap rows 2 and 3 in matrix [A] use rowSwap([A],2,3).

To add one row to another use **ALPHA** **D** :row+(from the **MATRIX** **▶** menu.

Method 2 Using rref(from the MATRX MATH menu

Enter the elements in the matrix as done in Method 1.

Keystrokes	Screen Display	Explanation
MATRIX ▶ ALPHA B	rref([A])	Enter the matrix mode and choose MATH using the arrow keys. Select the rref(
:rref([[1 0 0 -2.4285...	command and recall matrix A.
MATRIX 1 : [A]) ENTER	[0 1 0 1.57142...	This command will give the row-echelon form of matrix A, which has the identity matrix in the first three columns and constants as the fourth column.
	[0 0 1 .857142...	

Hence if a system of equations is

$$\begin{aligned} 2x_1 + x_2 + 5x_3 &= \\ 3x_1 + 2x_2 - x_3 &= -5 \\ 8x_2 - 3x_3 &= 10 \end{aligned}$$

with augmented coefficient matrix

$$\begin{bmatrix} 2 & 1 & 5 & 1 \\ 3 & 2 & -1 & -5 \\ 0 & 8 & -3 & 10 \end{bmatrix}$$

the solution, rounded to two decimal places, of the system of equations is

$$\begin{aligned} x_1 &= -2.43 \\ x_2 &= 1.57 \\ x_3 &= .86 \end{aligned}$$

B-16 Graphing an Inequality

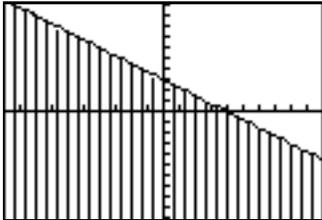

To graph an inequality:

- Change the inequality sign to an equals sign.
- Solve the equation for y.
- Enter this expression in the function list on the calculator. This is the boundary curve.
- Determine the half-plane by choosing a test point not on the boundary curve and substituting the test value into the original nequality.
- Graph the boundary curve using the lower shade option on the calculator to get a shaded graph.

Example 1 Graph $3x + 4y \leq 12$.

Solution:

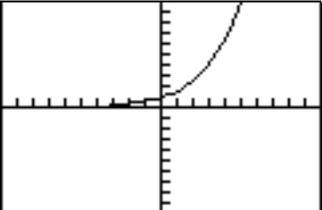

Changing the inequality sign to an equals sign yields $3x + 4y = 12$. Solving this equation for y yields $y = (12 - 3x)/4$. Determine the correct half-plane by substituting the point (0,0) into the original inequality. We have $3(0) + 4(0) \leq 12$, which is a true statement. Hence the point (0, 0) is in the solution set of the inequality.

Keystrokes	Screen Display	Explanation
Y= CLEAR (12	ClrDraw Done	Clear any existing graphs. Turn all plots off.
- 3 X,T,θ,n	\Y1=(12-3X)/4	Graph $3x+4y=12$ by first writing as $y=(12-3x)/4$.
) ÷ 4	Y1=(12-3X)/4	Determine the half-plane by choosing the point (0, 0) and substituting into the inequality by hand . $3 \cdot 0 + 4 \cdot 0 < 12$ is a true statement. The inequality is true for this point. Hence, we want the lower half-plane.
◀ ◀ ENTER ... ENTER		Use the left arrow to move the cursor to the graph style icon. Press enter repeatedly until the lower half is shaded. Graph.
GRAPH		

B-17 Exponential and Hyperbolic Functions

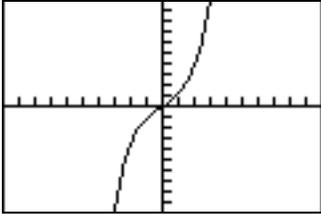

Example 1 Graph $y = 10^{0.2x}$

Solution:

Keystrokes	Screen Display	Explanation
Y= CLEAR 10 ^ (. 2	\Y1=10^(.2X)	Store the function and graph. Note the entire exponent needs to be in parentheses.
X,T,θ,n) ZOOM		
6 :ZStandard		

Example 2 Graph $y = \frac{e^x - e^{-x}}{2}$.

Solution:

Keystrokes	Screen Display	Explanation
$Y=$ [CLEAR] [(] [2nd] [e^x] [X,T,θ,n] [)] [-] [2nd] [e^x] [(-)] [X,T,θ,n] [)] [)] [=] [2] [ZOOM] [6] :ZStandard	$\backslash Y1=(e^X-e^{-X})/2$ 	Store the function and graph.
$Y=$ [▼] [CLEAR] [2nd] [CATALOG] [▼] [...] [▼] [ENTER] [X,T,θ,n] [)] [◀] [...] [ENTER] [ENTER] [ENTER] [ENTER] [GRAPH]	$\backslash Y2=\sinh(x)$	This is also the hyperbolic sine. So we could use sinh from the catalog list. Get the sinh from the catalog list. Enter X as the variable and graph. Store it as Y2 and use the graph style --0. Watch closely and you will see the --0 tracing the graph of Y1.

B-18 Scientific Notation, Significant Digits, and Fixed Number of Decimal Places

Example 1 Calculate $(-8.513 \times 10^{-3})(1.58235 \times 10^2)$. Enter numbers in scientific notation.

Solution:

Keystrokes	Screen Display	Explanation
[(-)] [8.513] [2nd] [EE] [(-)] [3] [ENTER]	$-8.513E-3$ $- .008513$	Enter the first number. The number displayed is not in scientific notation. (It is not necessary to press ENTER at this point. This is done here to show how the numbers are displayed on the screen.)
[×] [1.58235] [2nd] [EE] [2] [ENTER]	$Ans*1.58235E2$ -1.347054555	Multiply by the second number.

Example 2 Set the scientific notation to six significant digits and calculate $(351.892)(5.32815 \times 10^{-8})$.

Solution:

<u>Keystrokes</u>	<u>Screen Display</u>	<u>Explanation</u>
MODE ENTER	Normal Sci Eng	Select Sci using the arrow keys and press ENTER.
▼ ►►►►►►►	Float 0123456789	Select 5 decimal places using the arrow keys and press
ENTER	Radian Degree	ENTER. Five decimal places

Example 4 Graph $r = 5 - 5 \sin \theta$

Polar equations can be graphed by using the polar graphing mode of the calculator.

In general the steps to graph a polar function are:

- Step 1** Set the calculator in polar graph mode.
- Step 2** Enter the function in the Y= list (This list now has r= as the function names.)
- Step 3** Set the WINDOW FORMAT to PolarGC
- Step 4** Graph using the standard graph setting $\boxed{ZOOM} \boxed{6} \boxed{:} ZStandard$ and then the square setting of the calculator $\boxed{ZOOM} \boxed{5} \boxed{:} ZSquare$ to get a graph with equal spacing between the scale marks.
- Step 5** Zoom in to get a larger graph if you wish.

Solution:

Keystrokes	Screen Display	Explanation
<p>MODE</p> <p>▼ ▼ ▼ ► ►</p> <p>ENTER</p>	<pre>Normal Sci Eng Float 0123456789 Radian Degree Func Par Pol Seq Connected Dot Sequential Simul Real a+bi re^θi Full Horiz G-T</pre>	<p>Select polar mode.</p>
<p>2nd QUIT</p>		<p>Return to the Home screen.</p>
<p>Y= 5 - 5</p> <p>SIN X,T,θ,n)</p>	<pre>\r1=5-5sin(θ)</pre>	<p>Get the Y= list and enter the function as r1.</p>
<p>2nd FORMAT ►</p> <p>ENTER</p>	<pre>RecGC PolarGC CoordON CoordOff Cridoff GridOn AxesOn AxesOff LabelOff LabelOn ExprOn ExprOff</pre>	<p>Get the FORMAT menu on the WINDOW menu. Select PolarGC for polar graphs.</p>
<p>ZOOM 6 :Standard</p>		<p>Graph using the standard dimensions for the window. The graph on the standard screen is slightly distorted since the scale marks on the y axis are closer together than the scale marks on the x axis.</p>
<p>ZOOM 5 :Square</p>		<p>The square option on the Zoom Menu makes the scale marks the same distance apart on both axes. Press WINDOW to see how the window dimensions are changed.</p>
